(Odd Sem 2025-26)

Project Report On

“Library Management System”

(Project Stage-II (Major Project), CSE-PR-D501)

By

Arun Kumar (SBU232353), Sem: V, Section: A
Ashish Ranjan (SBU232624), Sem: V, Section: A
Ashish Kumar (SBU232582), Sem: V, Section: A

Under the guidance of

Mr. Nishant Kumar
Assistant Professor
Department of CSE

Sarala Birla University, Ranchi

November, 2025

Certificate

This is to certify that **Arun Kumar (SBU232353), Ashish Ranjan (SBU232624), and Ashish Kumar (SBU232582)** of Diploma in Computer Science and Engineering, 5th Semester, Section A, have successfully carried out the project work entitled “**Library Management System**” in partial fulfillment of the requirements for the award of the Diploma in Computer Science and Engineering from Sarala Birla University, Ranchi, under my supervision during Odd Semester 2025–26.

This project embodies the results of original work carried out by the students and has not been submitted for the award of any other degree or diploma to any other university or institution. The work presented in this report demonstrates the students’ skills in web development, database management, and backend programming using **HTML, CSS, JavaScript, PHP, and MySQL**.

The **Library Management System** developed by the students provides an automated, reliable, and user-friendly platform for managing books, users, and issue–return transactions efficiently, replacing traditional

Declaration

We, **Arun Kumar (SBU232353)**, **Ashish Ranjan (SBU232624)**, and **Ashish Kumar (SBU232582)**, students of Diploma in Computer Science and Engineering, 5th Semester, Batch (2023–26), hereby declare that the project report entitled “**Library Management System**”, which is submitted by us to the Department of Computer Science and Engineering, Sarala Birla University, Jharkhand, is an authentic record of our own work carried out under the supervision of **Mr. Nishant Kumar**, Assistant Professor, Department of CSE.

We further declare that this project is the result of our independent work and has not been submitted to any other institution or university for the award of any degree, diploma, or certification. All the resources and references from external sources have been properly acknowledged wherever applicable.

This project reflects our sincere efforts to design and develop a functional **web-based Library Management System** that automates book management, user registration, and issue/return transactions using technologies such as **HTML, CSS, JavaScript, PHP, and MySQL**.

Acknowledgement

We would like to express our sincere gratitude to our project guide **Mr. Nishant Kumar**, Assistant Professor, Department of Computer Science and Engineering, Sarala Birla University, Ranchi, for his constant guidance, valuable suggestions, and continuous encouragement throughout the development of our project titled **“Library Management System.”** His support and insights played a crucial role in helping us understand the concepts of web development, backend integration, and database management, which were essential in completing this project successfully.

We also extend our heartfelt thanks to **Dr. Pankaj K. Goswami (Dean)**, **Dr. Priyanka Srivastava (Head of Department – CSE)**, and our Program Coordinator **Dr. Santosh Kumar Das** for providing us with an excellent learning environment, necessary facilities, and academic support that enabled us to undertake and complete this project.

We would also like to acknowledge all the faculty members of the Department of CSE for their constant support, as well as our classmates, friends, and family for their encouragement, valuable feedback, and cooperation during the development of this system.

This project has enhanced our understanding of **HTML, CSS, JavaScript, PHP, and MySQL**, and has given us practical experience in designing and implementing a real-world web application.

Name of the Students:

Arun Kumar

Ashish Kumar

Ashish Ranjan

PROJECT SYNOPSIS

Student Name: Arun Kumar, Ashish Ranjan, Ashish Kumar

Enrolment No.: SBU232353, SBU232582, SBU232624

Program & Branch: Diploma CSE **Batch:** 2023 – 26 **Semester:** V **Section:** A

Academic Session: Odd Semester 2025-26

Project Guide Details:

Guide Name: Mr. Nishant Kumar

Designation: Assistant Professor, CSE, SBU

Project Information

1. Course Title: Project Stage-II (Major Project)

2. Courses Code: CSE-PR-D501

3. Credit Unit: 2

4. Project/ Internship Duration:

a) **Date of Project Commencement:** 6th October, 2025

b) **Synopsis Submission Date:** 4th November, 2025

c) **Date of Project Completion:** 1st November, 2025

5. Approved Project Title (*to be duly approved by the Project Guide*):

Library Management System

6. Objectives:

The main objective of this project is to develop a **web-based Library Management System** that automates book management, user registration, and transaction handling.

Key objectives include:

- Maintaining digital records of books, students, and issued/returned books.
- Providing an efficient, user-friendly web interface for the librarian/admin.
- Automating manual tasks such as issuing books, tracking returns, and generating reports.
- Ensuring fast search and retrieval of books and user information.
- Reducing data redundancy, paperwork, and chances of human error.
- Enhancing accuracy, transparency, and availability of library data.

7. Methodology to be adopted:

The project will be developed using the **Software Development Life Cycle (SDLC)** approach, following a structured and iterative model:

- a) **Requirement Analysis:** Study how libraries operate manually, identify challenges, and determine essential features such as book management, issue-return system, fine calculation, and user records.
- b) **System Design:** Designing ER diagrams, database schema (MySQL tables), webpage UI structure (HTML/CSS), and backend flow using PHP.
- c) **Implementation:**
using:
 - **HTML/CSS** for frontend layout,
 - **JavaScript** for validation and interactivity,
 - **PHP** for backend logic,
 - **MySQL** for persistent storage.
- d) **Testing:** Testing individual modules for functionality, including validation of inputs, duplicate entries, and incorrect book IDs. Integration testing ensures that all modules work together smoothly.
- e) **Deployment & Maintenance:** Running the project on a local server environment (XAMPP).
Future enhancements and maintenance based on feedback.

8. Brief Summary of the project:

The **Library Management System** is a dynamic web application designed to simplify and digitalize library operations. It includes an admin panel that allows the librarian to manage books, users, issue records, and return records efficiently. The system automates tasks such as book issuance, return tracking, and inventory management using a MySQL database.

Built using **HTML, CSS, JavaScript, PHP, and MySQL**, the system ensures fast, reliable, and secure handling of library data. It reduces manual workload, minimizes errors, and offers real-time access to information through an intuitive web interface. The project also introduces students to full-stack web development concepts and practical database integration.

1. INTRODUCTION

Libraries are an essential component of any educational institution, providing access to books, journals, academic resources, and study materials necessary for learning and research. As the number of users and resources increases, managing a library manually becomes highly inefficient and prone to errors. Traditional methods involve handwritten registers, physical record keeping, and separate logs for book issuance and returns. These processes are time-consuming, difficult to maintain, and often lead to data inconsistency, misplaced records, and operational delays.

To address these challenges, the **Library Management System (LMS)** has been developed as a **web-based automation solution**. This system digitizes and streamlines all major library operations such as book management, user registration, issuing and returning books, and maintaining transaction histories. The system eliminates manual paperwork by storing all records securely in a **MySQL database**, ensuring high data accuracy, availability, and reliability.

The project is implemented using modern web technologies:

- **HTML & CSS** for the user interface design,
- **JavaScript** for interaction and validation,
- **PHP** for backend processing and server-side operations,
- **MySQL** for storing and retrieving structured data.

The system offers an intuitive admin panel where the librarian can easily manage books, update inventory, register users, and monitor issue-return transactions. Features like automated availability checking, quick search options, and real-time updates significantly improve the speed and effectiveness of library operations.

This project not only reduces human effort but also minimizes errors caused by manual handling. It provides a centralized system where all library activities are recorded digitally, ensuring transparency and better data management. With its scalable and modular architecture, the Library Management System can be easily expanded in the future to include new features such as fine calculation, report generation, and student dashboards.

In conclusion, the Library Management System serves as a practical demonstration of full-stack web development using PHP and MySQL and showcases how automation can transform traditional library workflows into a more efficient, organized, and user-friendly digital environment.

2. PROBLEM ANALYSIS

In many educational institutions and libraries, book management, user registration, and transaction tracking are still handled manually. These manual processes lead to several inefficiencies, errors, and administrative challenges. The major problems identified are:

1. Data Inconsistency and Errors:

Maintaining handwritten records of books, issued copies, and user details often results in incorrect entries, duplication, or incomplete information. Misplaced or damaged registers make it difficult to retrieve accurate data when needed.

2. Time-Consuming Book Issuing and Returning Process

Issuing or returning a book manually requires checking availability, searching records, and updating multiple registers. This slows down operations, especially during peak hours, and increases waiting time for students.

3. Difficulty in Searching Books and User Records:

Without a digital system, librarians must search through physical records to find book details, user histories, or issue status. This is inefficient and becomes increasingly complex as library size grows.

4. No Real-Time Inventory Tracking:

Manual systems fail to show updated availability. Librarians often do not know:

- how many copies are available,
- which student has a book, or
- whether the return date has passed.

5. Error-Prone Data Maintenance:

Recording issue dates, return dates, fines, and user history by hand increases the risk of:

- Incorrect date entries,
- lost return records,
- missed overdue fines.

6. No Centralized Control or Reporting:

Physical registers have no protection from damage, theft, or accidental loss. Anyone can view or alter records, making the system insecure and unreliable.

7. Lack of Security and Data Backup:

Manual systems make it difficult to:

- generate reports,
- track monthly usage,
- analyze most issued books,
- monitor student borrowing behavior.

To overcome these limitations, a digital solution is necessary to streamline and automate daily library tasks. A web-based Library Management System provides centralized data storage, real-time inventory tracking, and instant access to book and user information. It reduces human error, eliminates redundant paperwork, and enhances the overall efficiency of library operations. By enabling fast searches, secure login-based access, and automated issue–return updates, the system ensures accurate record-keeping and improves the user experience for both librarians and students. Thus, the implementation of an automated LMS becomes essential for reliable, organized, and efficient library management.

3. SYSTEM IMPLEMENTATION DETAILS

Library Management System is implemented as a **web-based application** using modern frontend and backend technologies. The system's development involves structured coding, database integration, and modular design to ensure reliability and smooth operation.

Frontend Implementation

The frontend interface is built using:

- **HTML** – for designing the structure and layout of pages like login, dashboard, add books, issue books, and manage users
- **CSS** – for styling the interface, adding color themes, spacing, alignment, and responsive layouts
- **JavaScript** – for client-side validation, interactive elements, and preventing invalid inputs before submitting data

These components work together to provide a clean, user-friendly, and easy-to-navigate admin interface.

Backend Implementation

The backend is developed using **PHP**, which handles all server-side operations:

- Processing form submissions (add book, issue book, return book, add user)
- Handling admin login authentication and session management
- Communicating with the database for CRUD operations
- Updating book availability automatically during issue/return
- Preventing duplicate entries and validating request data

PHP acts as the core engine that connects all modules of the system.

Database Implementation

The system uses **MySQL** for data storage, with tables designed for:

- Books
- Students/Users
- Admin login
- Issued books
- Returned books

Key database features include:

- SQL queries for insert, update, delete, and search operations
- Real-time inventory updates
- Data integrity for issue-return tracking
- Secure storage of login credentials

Server Environment

The project runs on **XAMPP**, which provides:

- Apache server for hosting the PHP application
- MySQL for database management
- phpMyAdmin for easy database access

Modular Design Structure

The system is divided into independent modules:

- **Login Module** – admin authentication
- **Book Management** – add, update, delete, search books
- **User Management** – add and manage student/user records
- **Issue Module** – issue books, check availability
- **Return Module** – record returns and update stock
- **Dashboard** – display summary statistics

Testing & Validation

- JavaScript validation for form inputs
- PHP validation for backend data integrity
- Module-wise testing for functionality
- Database testing for transaction accuracy

4. SYSTEM DESIGN

The system design phase defines the structure, architecture, and flow of the Library Management System. It ensures that the application is modular, scalable, and easy to maintain. The design focuses on dividing the system into meaningful components such as the frontend interface, backend logic, and database structure.

1. System Architecture

The Library Management System follows a **three-layered architecture**:

A. Presentation Layer (Frontend)

- Designed using **HTML, CSS, and JavaScript**
- Provides user interfaces for login, dashboard, book management, issue/return, and user management
- Ensures clean navigation and responsive interface

B. Business Logic Layer (Backend)

- Implemented using **PHP**
- Handles login authentication, CRUD operations, and database interaction
- Responsible for data validation, transaction processing, and system flow control

C. Data Layer (Database)

- Uses **MySQL** for structured data storage
- Includes tables for books, users, issued books, returned books, and admin credentials
- Ensures data integrity, indexing, and secure record management

2. Modular Design

The system is developed using a modular approach to keep functionality organized and maintainable.

Main Modules:

- **Login Module** – verifies admin credentials and manages sessions
- **Dashboard Module** – displays total books, users, issued and returned books
- **Book Management Module** – add, update, delete, and search books
- **User Management Module** – register new users and manage existing records
- **Issue Module** – checks availability and issues books to students
- **Return Module** – updates stock and records returned books

- **Reports Module** – displays history of issued and returned books

3. User Interface (UI) Design

The UI design focuses on simplicity, ease of use, and clear categorization of tasks.

Key UI Features:

- Clean and structured forms for all inputs
- Navigation bar for quick access to modules
- Dashboard displaying real-time statistics
- Search bars for fast book and user lookup
- Confirmation messages for actions (Issue, Add, Delete, Return)

4. Data Flow Design

The flow of data in the system is designed to ensure smooth operation and accuracy:

A. Input Stage

User admin enters data through HTML forms.

B. Processing Stage

PHP validates inputs and processes operations such as:

- Adding books
- Issuing books
- Updating records
- Handling login
- Storing or modifying data

C. Database Interaction

PHP executes SQL queries to:

- Insert new records
- Update availability
- Retrieve information
- Delete outdated entries

D. Output Stage

The system displays:

- Success/failure messages

- Updated tables
- Book availability
- Transaction reports

5. Security Design

The system includes basic security measures:

- **Session handling** to prevent unauthorized access
- **Password protection** for admin account
- **Validation** for all forms to prevent invalid/duplicate entries
- **Database integrity** to ensure consistent records

6. Scalability

The design is flexible and allows future enhancements like:

- Student login portal
- Fine calculation
- Data analytics dashboard
- Multi-admin access
- Cloud hosting

5. Figures

- **Login Page:** Allows authorized users to enter their credentials and securely access the system.

The current web-based Library Management System successfully automates essential library operations such as book management, user registration, and book issue–return tracking. However, the system can be enhanced further to improve usability, security, and functionality. Potential future improvements include:

- **Student Login Module:**

Adding a separate portal for students to check issued books, due dates, and search available titles.

- **Fine Calculation System:**

Automatically calculating overdue fines based on return dates and updating the user's record.

- **Advanced Search Filters:**

Implementing filters like category, author, publication year, and availability to improve search efficiency.

- **Report Generation:**

Generating monthly or yearly reports on issued books, returned books, and library usage statistics for admin analysis.

- **Mobile Application Integration:**

Developing an Android/iOS app version for easier access and notifications.

- **Cloud Deployment:**

Hosting the system on cloud platforms for multi-location access, backup safety, and better scalability.

- **Barcode / QR Code Integration:**

Enabling faster issue-return operations using barcode or QR scanning of books and user IDs.

7. CONCLUSION

The **Library Management System** developed in this project provides an efficient, reliable, and user-friendly platform for automating key library operations. By replacing traditional manual record-keeping with a fully digital solution, the system significantly reduces human errors, eliminates paperwork, and enhances the accuracy and accessibility of library data. With modules for book management, user registration, issue–return tracking, and real-time inventory updates, the system ensures that library tasks can be performed smoothly and quickly.

The project showcases the effective use of full-stack web development technologies such as **HTML, CSS, JavaScript, PHP, and MySQL**, demonstrating how these tools can be combined to build a functional and organized information system. Through structured design, modular coding, and database integration, the system offers clear navigation, secure login-based access, and automated transaction handling. The implementation of this project has also strengthened our understanding of backend logic, database queries, form validation, and overall system workflow.

While the system fulfills its core objectives, it also leaves room for future enhancements such as fine calculation, student login modules, mobile app integration, and advanced reporting tools. These improvements can further elevate the system’s capabilities and make it suitable for larger institutions with more complex requirements.

In conclusion, the Library Management System successfully demonstrates how automation and web technologies can transform traditional library operations into a faster, more secure, and more efficient digital environment, benefiting both administrators and users.

WEEKLY PROGRESS REPORT (WPR) (Odd Semester 2025 - 2026 Session)

(To be submitted by the Student to his/her Project Faculty Guide on every Monday)

Student Name: Mr. Ashish Ranjan **Reg. No. :** SBU232624 **Group No.:** 02, **Program:** Diploma(CSE), **Batch:** 2023-26, **Sem &Sec-** V-A

Guide Name: Mr. Nishant Kumar **Commencement Date:** 06/10/2025, **Project Completion Date:** 01/11/2025, **WPR No:** 01

Approved Project Title: Library Management System

Course Title: Project Stage - II, **Course Code,** CSE-PR-D501;

Current Week Duration: 06/10/2025 to 12/10/2025; **WPR submitted on (date):** 13/10/2025__

Day / Date	Summary (The first week focused on requirement analysis, system planning, environment setup, and initial UI framework preparation.)
MON – 06/10/25	The project topic was finalized and the main objectives of the Library Management System were clearly defined.
TUE – 07/10/25	Detailed analysis of existing manual library processes was carried out to identify operational limitations and system requirements.
WED – 08/10/25	Core system modules such as Login, Dashboard, Book Management, User Management, and Issue/Return were identified and documented.
THU – 09/10/25	The initial system workflow and data flow design were prepared to outline interaction between UI, backend, and database.
FRI – 10/10/25	The development environment was configured using XAMPP, and PHP–MySQL connectivity was tested successfully.
SAT – 11/10/25	Preliminary UI planning was completed by designing structural layouts for the login and dashboard pages using HTML frameworks.
SUN – 12/10/25	The project directory structure, base PHP files, and configuration settings were organized to begin functional development.

WEEKLY PROGRESS REPORT (WPR) (Odd Semester 2025 - 2026 Session)

(To be submitted by the Student to his/her Project Faculty Guide on every Monday)

Student Name: Mr. Ashish Ranjan **Reg. No. :** SBU232624 **Group No.:** 02, **Program:** Diploma(CSE), **Batch:** 2023-26, **Sem &Sec-** V-A

Guide Name: Mr. Nishant Kumar **Commencement Date:** 06/10/2025, **Project Completion Date:** 01/11/2025, **WPR No:** 02

Approved Project Title: Library Management System

Course Title: Project Stage - II, Course Code, CSE-PR-D501; **Current Week Duration:** 13/10/2025 to /19/10/2025; **WPR submitted on (date):** 20/10/2025

Day / Date	Summary (The second week focused on building the login system, backend authentication, database setup, and integrating a functional dashboard.)
MON – 13/10/25	The complete login page interface was developed using HTML and CSS with emphasis on usability and clarity.
TUE - 14/10/25	Admin authentication was implemented using PHP, and secure database-based login validation was established.
WED – 15/10/25	Database tables for admin, books, users, issued books, and returned books were created and tested with sample inserts.
THU – 16/10/25	JavaScript-based client-side validation and PHP-based session handling were integrated to enhance security and reliability.
FRI – 17/10/25	The admin dashboard layout was designed with placeholders for essential library statistics and quick-access navigation.
SAT – 18/10/25	Live database connections were integrated into the dashboard to fetch and display real-time totals for books, users, and transactions.
SUN – 19/10/25	Combined testing of the login and dashboard modules was performed to ensure proper session flow and database interaction.
